SHE RESCUE BARREL®

SHE RESCUE BARREL® Patented innovative solution for storing and transporting

All abseiling and rescue equipment must be inspected annually - regardless of whether it has been used or stored exclusively for emergencies in wind turbines. With the SHE RESCUE BARREL, we have succeeded for the first time in reducing cost-intensive tests and investments to a minimum. By a protected heat treatment process, our SHE RESCUE LIFT is stored absolutely gas-, water- and UV-proof in the SHE RESCUE BARREL. The annual inspection is limited to a visual inspection only, whereby the expert checks the perfect condition of the seal and the SHE RESCUE BARREL. If no defects are found during the annual visual inspection, a functional test of the device by the manufacturer or a person commissioned by the manufacturer is **only necessary after 10 years from the date of manufacture.**

The SHE RESCUE BARREL also sets new standards in the field of ergonomics. A carrying system specially developed for the SHE RESCUE BARREL simplifies handling and makes it easier for service and maintenance personnel to carry the SHE RESCUE BARREL. A sling adapted to the system enables the SHE RESCUE BARREL to be safely transported into the machine room of the system by means of a service crane or service winch.

We have developed a drum holder for the safe storage and attachment of the SHE RESCUE BARREL.

This can be mounted easily and without drilling at any position in the nacelle or in the base of the tower by means of clamps.
